To determine the proper amount of **Pertinent Fly Control IGR** per ton of feed to prevent horn fly emergence, multiply the factor by the CWT and divide by the feed rate.

## EXAMPLE:

Pounds of **Pertinent Fly Control IGR 0.4%** needed in a ton of feed to prevent horn flies on a 1,200 lb. animal consuming 4 oz. of mineral per day.

$$\frac{1.25 \times 12 \text{ CWT}}{0.25 \text{ lbs. of feed per day per animal}} = 60 \text{ lbs. of Pertinent IGR 0.4\% per ton of feed}$$
